

LET'S FIRST RECAP!

PUZZLE HEIST!

PRESS START

RULES

**Each group gets a puzzle sheet with
multiple rounds of questions**

Solve the puzzle revealing a passcode

YOU HAVE 15 MINS !

ARE YOU
READY?

indexing: a numbering
of elements/characters
begins with 0

5TH LETTER IN WORD = 4TH INDEX

0 1 2 3 4 5 6 7
Word = "E N V E L O P E"

0 1 2 3 4 5 6 7 8 9 10 11 12 13
Band = "G U N S A N D R O S E S"

Accessing letters and slicing

Band [5] = 'A'

Band [4] = ' '

Band [0] = 'G'

Band [-1] = 'S'

SPACES ARE ALSO CHARACTERS

FIRST CHAR IN THE STRING

LAST CHAR IN THE STRING

Band [5 : 8]

Band [: 5]

Band [9 :]

IN BUILT STRING FUNCTIONS

(functions you can use without having created them yourself)

Where might we use these? What datatype values do you think they return?

| | |
|---------------------------------|--------------------------------------------------------|
| <code>text.lower()</code> | Converts all characters to lowercase |
| <code>text.upper()</code> | Converts all characters to uppercase |
| <code>text.find('cloud')</code> | Checks if the string 'cloud' is present in string text |
| <code>text.count('or')</code> | Counts number of times 'or' is present in string text |
| <code>text.isalpha()</code> | Checks if all of a string's characters are alphabets |
| <code>text.isdigit()</code> | Checks if all of a string's characters are digits |

ASCII Codes

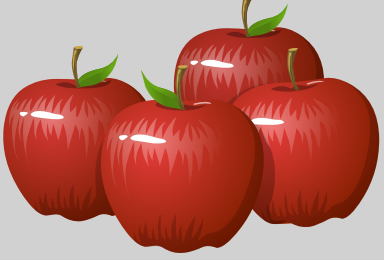

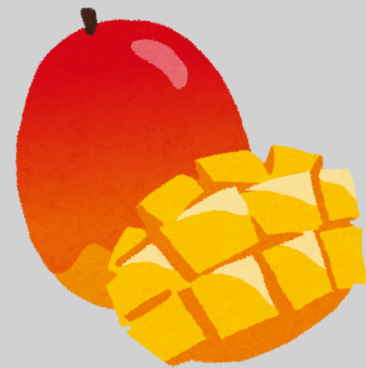

Numeric representation
of characters such as
digits, letters, & symbols

`ascii_code= ord('A')`
`chr(65)= 'A'`

why might this be useful?

Arrays

| 0 | 1 | 2 | 3 | 4 |
|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|  |  |  |  |  |

fruits = ["apples", "bananas", "oranges", "mangoes", "grapes"]

accessing elements

fruits [0], fruits [1], etc.

follows the similar
indexing starting
from 0 as in strings

**How might we perform a swap of elements? say we
want to swap the first and last element.**

```
temp = fruits[0]  
fruits[0]=fruits[-1]  
fruits[-1]=temp
```

IN BUILT ARRAY FUNCTIONS

(functions you can use without having created them yourself)

| | |
|------------------------------|----------------------------------------------------|
| <code>array.append(x)</code> | Adds element x to the array |
| <code>array.remove(x)</code> | removes the element from the array |
| <code>array.sort()</code> | Sorts the array in place |
| <code>array.count(x)</code> | counts the number of times x is present in array |
| <code>array.index(x)</code> | gives us the index location of first instance of x |

YOUR TURN!

SOLVE

Behavioural profiling: Not just what you click, but what you might do
(predictive models).

Trying to categorize you based on behavior.

Activity: Call up a three people from class and make them read out a list
of ten things they recently searched up that they are ok sharing

What ads would you recommend them, how might they be tagged?

What are some design tricks used to nudge people into consent to tracking?
(aka dark patterns)

Political angle: How can data tracking control political systems or undermine democracy?
